NEW IMPROVED WEEDONE

DOES NOT give off vapors that injure sensitive plants such as Rose bushes, Tomatoes, flowers, or ornamental shrubs. No other weed killer has as many uses as New Improved Weedone. Among the many uses are:

- 1—A selective weed killer on lawns for killing weeds without injury to grass.
- 2—A pre-emergence spray for crabgrass in lawns.
- 3—Killing weeds in vacant lots, fence rows and pastures.
- 4—Killing poison ivy, poison oak, briars and over 100 other woody plants.
- 5—Killing stumps to prevent suckering and regrowth.
- 6—Total kill of all vegetation in driveways, walks, tennis courts, etc.

In addition to the advantages mentioned above, New Improved WEEDONE is not poisonous to livestock or humans, will not sterilize the soil, does not corrode equipment and can be applied with any type sprayer.

Also, New Improved WEEDONE has an important place in all fall lawn renovation programs. An ideal plan is to fertilize, lime and seed in accordance with the needs of the lawn as early in September as possible. WEEDONE may be applied either during August (at least two weeks before seeding) or in later October after the grass has been cut once or more. When WEEDONE is applied in the fall the lawn will be relatively free of weeds the following spring.

MOTO-MOWERS

A Size for Every Lawn

QUALITY MOWERS THAT HAVE STOOD THE TEST OF TIME

Moto-Boy

THE COMMANDER

**Moto-Mowers—Wheel Type. Wheels Rearward and
Within Cutting Width**

The Commander, although a wheel type of mower, combines the desirable features of a roller mower due to the traction wheels being rearward of, but within the cutting width of the reel.

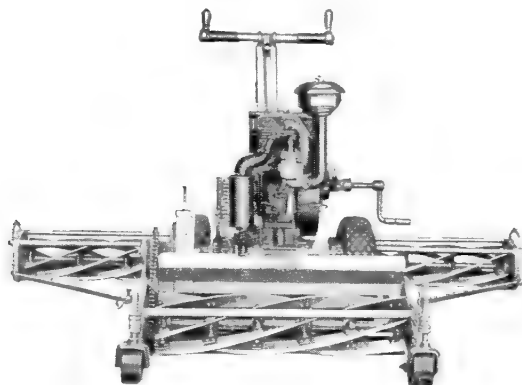

The Commander over-all width is exceedingly narrow when compared to its cutting width, the mower being but 35 in. wide although equipped with a 30 in. reel. It is possible to cut much closer to an object than with the usual type of wheel mower, and to extend the cutting unit over the edge of the lawn when trimming along driveways or raised borders.

Likewise the over-all width of the Commander Triplex which has a 71 inch cutting width is but 75 inches.

Power driven cutting units have no wheels or casters—they contact the ground on rollers to the rear of the reel and may be extended over the edge of the lawn when trimming. Will cut 12 to 15 acres per day.

STEEL BEAM MOLDBOARD PLOWS

Empire Steel Beam Moldboard Plows have been proven and carefully field tested over a period of years and it is a generally accepted fact that they do better work. The shares are hardened and reinforced on the point with an extra lay of special steel for additional strength and to facilitate re-pointing when worn. Made with a double steel land-side, with an adjustable land-side heel for regulating the bottom suck and taking up wear.

SAWS

THE "IRELAND 33" TRACTOR-MOUNTED TYPE

For Ease in Cutting Your Fuel Wood . . .

The heavy, 2-inch tubular steel frame is rugged. Electrically welded, one-piece, rigid construction gives maximum strength without excessive weight. One man can mount rig to tractor and swing it up into traveling position.

The big table is "balanced" for easy day-long operation. Swings true. Cuts long or short sticks square-ended for easy splitting. 33-inch table handles longer logs without effort of operator to hold them down.

BEMIS TRANSPLANTER

TWO ROW TRANSPLANTER

Save With Two Row

The two row transplanter not only effects a saving at planting time, but makes it possible to cultivate the crop with the two row tractor cultivator; so the two row makes a saving in labor during the entire season.

Strong Construction

The main frame of the two row is very strong and rigid. The main axle bar is welded into a single assembly giving great strength without undue weight.

The 36-inch steel wheels are very strong and have a heavy concave tire 8 inches wide.

The Madison two row transplanter embodies all of the exclusive features that have combined to make the BEMIS horse-drawn transplanter the leader for more than 50 years.

It sets rows 39 inches and 42 inches apart.

Floating Shoe

Only BEMIS transplanters have the full floating shoe. The most essential part of a transplanter is the shoe assembly. On the BEMIS, the entire shoe assembly can be set so it is free to float when the runner is in the ground. The droppers furnish the necessary pressure to keep the runner in the ground and firm the soil about the plants by means of the pressure yoke. This pressure can be adjusted for different weight droppers or different soil conditions by moving the loops attached to the seat bars in different notches in the pressure yoke.

No Missing Plants

The floating shoe permits the runner to follow the contour of the ground. There are no missing plants in planting across a dead furrow or depression. Every plant is set at a uniform depth; all evenly packed.

The depth lever can be locked at any depth desired.

Band Type Fertilizer Attachments For All Bemis Transplanters

- Two spouts carry the fertilizer into the furrow openers that place it in the ground in bands about three inches on each side of the row of plants. The depth of the furrow openers can be adjusted to suit various crops, and different soil conditions. The furrow openers raise and lower with the regular lift lever—no extra levers.

Proper Amount of Fertilizer

The sprocket supplied with the transplanter for regulating each valve. This amount can be varied from 150 to 1000 pounds or more per acre. Where a very light application is desired, one of the valves can be completely closed, applying the fertilizer on one side of the row only.

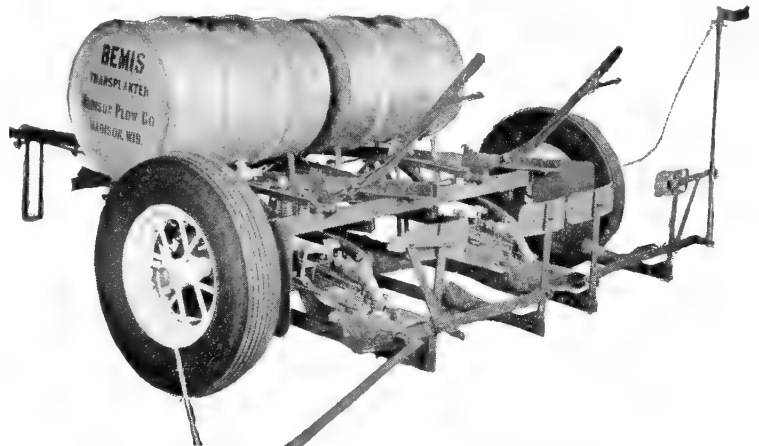

Where a very heavy application is wanted, the regular sprocket on the fertilizer attachment can be replaced with a smaller one which revolves the feed star faster.

The sprocket supplied with the transplanter for regulating the distance between the plants is interchangeable with the sprocket on the fertilizer attachment.

A hand lever, conveniently located for operation by one of the droppers, permits starting and stopping the attachment as desired. The hopper is ample size, holding more than a hundred-pound bag of fertilizer.

Than Any Other Transplanter in the World

BEMIS TRANSPLANTER

The loss of plants set with a Bemis rarely exceeds 1% compared with a loss of 10 to 40% in plants set by hand. It is not necessary to wait for rain when a Bemis is used. The plants can be set when they are the right size; they start growing quickly, mature early and evenly.

Any Spacing Desired

The plants are evenly spaced, at the exact distance apart that is desired. This insures the maximum number of plants per acre. The distance between the plants in the row can be varied from 11 inches to 77 inches apart by using different sprockets furnished as regular equipment.

Single row transplanters use 6.00x16 inch tires.

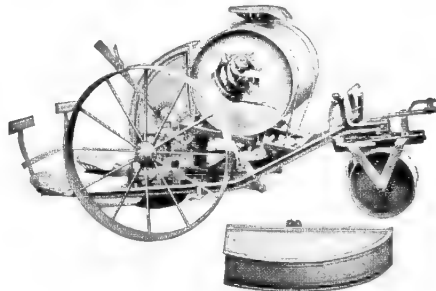

Two row transplanters use 7.50x16 inch tires.

Rubber tires are not included.

THE IMPROVED TIGER TRANSPLANTER

The Tiger transplanter is adjustable to all conditions of planting and spacing; adjustable to all conditions of soil and ground—on hillside or level, will space plants from 14 to 64 inches apart, and operates as readily with either horse or tractor power.

Driver and two planters can set five acres a day without undue strain or hurry. Here is a definite, money-saving implement that will handsomely repay every owner.

Almost human in its operation, here is one of the greatest boons to transplanting ever developed. Eliminates packing around the plant; eliminates pouring water on the surface to break and crack the earth around the plant.

RECUTTER

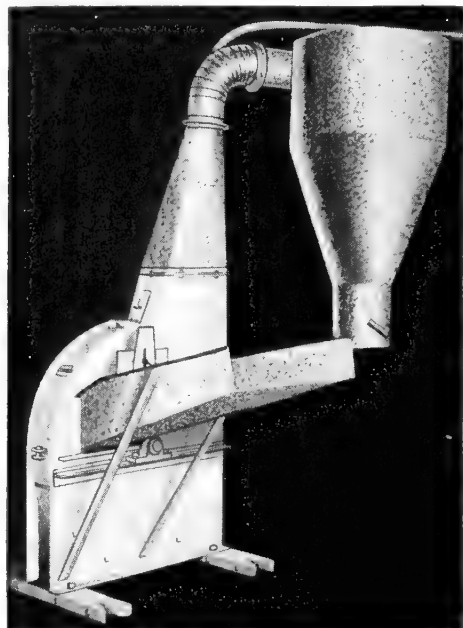

Grinds Faster Than an Ordinary Hammer Mill—Cuts Power in Half

Paying livestock and poultry are the best feed factories in the world. Market your crop on the hoof with the HATCHET Hammer Mill as your right-hand helper. The HATCHET Hammer Mill makes your feed go as much as 35 per cent farther!

Coarse, stalky roughage discourages livestock's appetite. Up to 35 PER CENT is nosed out of the feed box, trampled into mud or manure. Unground grain goes through undigested, lost forever or left second-hand for hogs. Adjust the HATCHET Hammer Mill coarse or fine to fit the feed, and the ration for

which it is intended. From the finest mash to trench silage. HATCHET Hammer Mill-processed feed brings more dollars rolling in!

You will blink your eyes in wonder when you first see the PNEUMATIC FEED work. The Hatchet Mill is the only silo filler of its kind with pneumatic feed. As the bundle reaches the knives, it is drawn in automatically by suction. No rollers, no gears, no belts, no chains . . . no dangerous hand feeding. Relax . . . put your mind at ease with the Smalley!

LAWN GRASSES should be used at the rate of one pound to 200 square feet, 100 lbs. per acre. Very much better results can be had from lawn seeding if it is done early in the spring just as soon as the soil can be conditioned, so as to allow ample time for development of a healthy root growth that will survive summer heat. **DO NOT** expect to have a good lawn on poor worn out soil. You must use lawn food.
